

# L05 Tableau Proofs in Propositional Logic

## Chapter 4

### 1. Motivation

Major concept  $\Sigma \models \sigma$

One goal is to *automatically* construct a proof to show the above

First work on  $\{\} \models \sigma$ , i.e.,  $\sigma$  is a tautology.

Tableaux proof idea (intuition: proof by contradiction)

$(A \vee \neg A)$  is tautology

Proof (by contradiction) [informal]

Assume  $(A \vee \neg A)$  is F.

(working forward) by definition of  $\vee$

(1) A is F, and

(2)  $\neg A$  is F

(3) A is T (by (2) and definition of  $\neg$ )

Contradiction (1) and (3)

QED

Prove  $(A \wedge B)$  is tautology

Proof (by contradiction) [**not a proof** below]

Assume  $(A \wedge B)$  is F.

(working forward) by definition of  $\wedge$

We consider two case

(1) A is F .... No contradiction

(2) **OR** B is F ... No contradiction

No Contradiction

QED

| we consider 3 cases

| A is F B is T

| A is F B is F

| A is T B is F

## 2. Motivation of tableaux proof

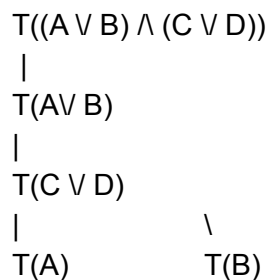

---

Motivation of tableaux proof: proof by contradiction. A signed proposition  $F\alpha$  means assume  $\alpha$  is false or we would like  $\alpha$  to be false. Worked out atomic tableaux ourselves. Work out a few examples on reducing a signed proposition (all paths are contradiction, no path is contradiction or some contradiction and some not)

Finishing studying the finite tableaux / tableaux definition. Check what are defined? Using drawing (tree, path) to check understanding of the definition.

---

A precise informal reading of signed proposition:

$F(\alpha)$ : we would like to find a way (valuation) to make  $\alpha$  to be false

$T(\alpha)$ : we would like to find a way (valuation) to make  $\alpha$  to be true

Entries on a path is understood as conjunction. For example

Read as we would like to find a valuation to make  $A \vee B$  true and to make  $A$  true.

In this case, since we have to make  $A$  to be true and thus  $A \vee B$  true, we don't need to consider an alternative case of making  $B$  to be true.

Prove  $((A \rightarrow B) \rightarrow A) \rightarrow A$  is a tautology

### 3. Studying the definitions

#### 3.1 Definitions of finite tableau and tableau

Read from tableaux def (most time of class spent on the first definition)

1a	1b	2a	2b
$TA$	$FA$	$  \begin{array}{c}  T(\alpha \wedge \beta) \\    \\  T\alpha \\    \\  T\beta  \end{array}  $	$  \begin{array}{cc}  & F(\alpha \wedge \beta) \\  & / \quad \backslash \\  F\alpha & & F\beta  \end{array}  $
3a	3b	4a	4b
$  \begin{array}{c}  T(\neg\alpha) \\    \\  F\alpha  \end{array}  $	$  \begin{array}{c}  F(\neg\alpha) \\    \\  T\alpha  \end{array}  $	$  \begin{array}{cc}  & T(\alpha \vee \beta) \\  & / \quad \backslash \\  T\alpha & & T\beta  \end{array}  $	$  \begin{array}{c}  F(\alpha \vee \beta) \\    \\  F\alpha \\    \\  F\beta  \end{array}  $
5a	5b	6a	6b
$  \begin{array}{cc}  & T(\alpha \rightarrow \beta) \\  & / \quad \backslash \\  F\alpha & & T\beta  \end{array}  $	$  \begin{array}{c}  F(\alpha \rightarrow \beta) \\    \\  T\alpha \\    \\  F\beta  \end{array}  $	$  \begin{array}{cc}  & T(\alpha \leftrightarrow \beta) \\  & / \quad \backslash \\  T\alpha & & F\alpha \\    & &   \\  T\beta & & F\beta  \end{array}  $	$  \begin{array}{cc}  & F(\alpha \leftrightarrow \beta) \\  & / \quad \backslash \\  T\alpha & & F\alpha \\    & &   \\  F\beta & & T\beta  \end{array}  $

**Definition 4.1** A **finite tableau** is a binary tree, labeled with signed propositions called entries, that satisfies the following inductive definition:

- (i) All atomic **tableaux** are finite **tableaux**.
- (ii) If  $\tau$  is a finite tableau,  $P$  a path on  $\tau$ ,  $E$  an entry of  $\tau$  occurring on  $P$  and  $\tau'$  is obtained from  $\tau$  by adjoining the unique atomic tableau with root entry  $E$  to  $\tau$  at the end of the path  $P$ , then  $\tau'$  is also a finite tableau.

If  $\tau_0, \tau_1, \dots, \tau_n, \dots$  is a (finite or infinite) sequence of finite **tableaux** such that, for each  $n \geq 0$ ,  $\tau_{n+1}$  is constructed from  $\tau_n$  by an application of (ii), then  $\tau = \cup \tau_n$  is a **tableau**.

Drawing a picture helps to understand the definition.

Exercise: figure out the union of graphs, apply it to the union of two finite tableaux

$$G1 = (V1, E1) \quad G2 = (V2, E2)$$

$$G1 \cup G2 = (V1 \cup V2, E1 \cup E2)$$

### 3.2 Definitions of tableau proof and complete systematic tableau

We would like to precisely define

- Tableau proof, and
- A systematic way to construct a tableau proof called complete systematic tableau
  - Continue to “analyze” (or reduce) each node in a tableau until each node is “reduced” (so that no cheating to say there is no tableau proof by intentionally stopping the analyze of each node)

**Definition 4.2** Let  $\tau$  be a tableau,  $P$  a path on  $\tau$  and  $E$  an entry occurring on  $P$ .

- (i)  $E$  has been **reduced** on  $P$  if all the entries on one path through the atomic tableau with root  $E$  occur on  $P$ . (E.g.,  $TA$  and  $FA$  are reduced for every propositional letter  $A$ .  $T\neg\alpha$  and  $F\neg\alpha$  are reduced (on  $P$ ) if  $F\alpha$  and  $\alpha$ , respectively, appear on  $P$ .  $T(\alpha \vee \beta)$  is reduced if either  $T\alpha$  or  $T\beta$  appears on  $P$ .  $F(\alpha \vee \beta)$  is reduced if both  $F\alpha$  and  $F\beta$  appear on  $P$ .)
- (ii)  $P$  is **contradictory** if, for some proposition  $\alpha$ ,  $T\alpha$  and  $F\alpha$  are both entries on  $P$ .  $P$  is **finished** if it is contradictory or every entry on  $P$  is reduced on  $P$ .
- (iii)  $\tau$  is **finished** if every path through  $\tau$  is finished.
- (iv)  $\tau$  is **contradictory** if every path through  $\tau$  is contradictory. (It is, of course, then finished as well.)

**Definition 4.3** A **tableau proof** of a proposition  $\alpha$  is a contradictory tableau with root entry  $F\alpha$ . A proposition is **tableau provable**, written  $\vdash \alpha$ , if it has a tableau proof.

A **tableau refutation** for a proposition  $\alpha$  is a contradictory tableau starting with  $T\alpha$ . A proposition is **tableau refutable** if it has a tableau refutation.

**Definition 4.4** Let  $R$  be a signed proposition. We define the **complete systematic tableau (CST)** with root entry  $R$  by induction.

- Let  $\tau_0$  be the unique atomic tableau with  $R$  at its root.
- Assume that  $\tau_m$  has been defined. Let  $n$  be the smallest level of  $\tau_m$  containing an entry that is unreduced on some noncontradictory path in  $\tau_m$  and let  $E$  be the leftmost such entry of level  $n$ . We now let  $\tau_{m+1}$  be the tableau gotten by adjoining the unique atomic tableau with root  $E$  to the end of every noncontradictory path of  $\tau_m$  on which  $E$  is unreduced. The union of the sequence  $\tau_m$  is our desired complete systematic tableau.

**Theorem 4.5** Every CST is finished.

**Theorem 4.6** If  $\tau = \cup \tau_n$  is a contradictory tableau, then for some  $m$ ,  $\tau_m$  is a finite contradictory tableau. Thus, in particular, if a CST is a proof, it is a finite tableau.

**Definition 4.7** Define the **degree of a proposition**  $\alpha$ ,  $d(\alpha)$  by induction:

- If  $\alpha$  is a propositional letter, then  $d(\alpha) = 0$ .
- If  $\alpha$  is  $\neg\beta$ , then  $d(\alpha) = d(\beta) + 1$ .
- If  $\alpha$  is  $\beta \vee \gamma$ ,  $\beta \wedge \gamma$ ,  $\beta \rightarrow \gamma$  or  $\beta \leftrightarrow \gamma$ , then  $d(\alpha) = d(\beta) + d(\gamma) + 1$ . The degree of a signed proposition  $T\alpha$  or  $F\alpha$  is the degree of  $\alpha$ . If  $P$  is a path in a tableau  $\tau$ , then  $d(P)$  the degree of  $P$  is the sum of the signed propositions on  $P$  that are not reduced on  $P$ .

**Theorem 4.8** Every CST is finite
